TravelMap

Web application for creating tourist routes

Boyan Bayginov

Motivation

Problem: Many tourist destinations and descriptions scattered across many sites

Solution: A centralized platform to review various destinations, along with articles and information about events in them

Service: Creating routes that may be publicly accessible by anyone

Goals

1. Easy to maintain and manage application

2. Maximum user experience

3. Protection of user data

Used technologies

1. ASP.NET
2. EFCore
3. SQL Server
4. HTML
5. CSS
6. JavaScript
7. ASP.NET Core Identity

Realization

The steps to create a ready-made product

Planning

1. Research of similar projects
2. Definition of functionalities
3. Selection of technologies
4. Database design
5. Architecture planning

Creating models

1. The model describes an object from the website

2. Defined on permissible values

3. Linking models

4. Defining deletion rules

Site protection

1. Authorization: user accounts

2. Authentication: access control by roles

3. Data integrity

Server logic

1. Unregistered user and authentication

2. User without privileges

3. Administrator

Web interface

1. Structure and communication with the database (HTML)

2. Building a user interface (Bootstrap)

3. User experience (JavaScript)

Testing and optimization

1. Debugging logical errors

2. Improving design adaptability

3. Memory management

Conclusion

Plans for future development:

1. Implementing Google Maps for destinations

2. Adding user reviews and ratings

Thank you for your attention!
